Introduction

Personal and Lab Introduction

- Third year PhD student under Dr. Mehmet Belviranli
- Started undergraduate studying mining engineering
- Research interests
 - Efficient machine learning inference
 - Object detection & multi-object tracking
 - Edge/heterogenous/accelerated computing
- Experience with
 - NVIDIA Jetson platform
 - Luxonis OAK cameras
 - Raspberry Pi
- Lab Members
 - 3 PhD students
 - 2 Masters with thesis students
 - Undergraduate students
- Research interests
 - Diversely heterogeneous architectures
 - Performance & resource modeling
 - AI acceleration
 - Autonomous computing
 - Parallel programming paradigms
 - Runtime systems
 - Large-scale superconducting computers
 - Next generation transistors

Research Work

Current/Past Work

- Ongoing

Context-aware Multi-Model Object Detection for Diversely Heterogeneous Compute Systems

Justin Davis
Mehmet E. Belviranli

Best Paper in Autonomous System Design – DATE24
Slides adapted from DATE24 presentation

Object Detection on SoCs

- Smaller/larger parameterizations
 - Allow accuracy/latency trade off between models
 - Larger models on edge platforms see increased latency and power draw
- Inter-Model Relationships
 - Strict monotonic relationships between energy, accuracy, and latency

Object Detection using Multiple Models + Multiple Accelerators

- Running DNNs on multiple accelerators:
 - Adds scheduling complexity
 - Enables energy, accuracy, and latency tradeoffs
- Using multiple DNN architectures
 - Remove strict monotonic relationships

Challenges

1. We need to determine context at runtime.
2. We need to assess the current accuracy of models based purely on runtime context.
3. How many models we can load at once is restricted by the shared memory system.
4. We need to choose models without true knowledge of their prediction strength.

Where are we within our environment?

How does model X perform while the drone is here?

Shared memory limits individual capacity

Overview of SHIFT

- Model Characterization
 - Identify key traits of each model
 - Construct confidence graph
- SHIFT Scheduler
 - Context detection
 - Heuristic scheduler

Overall Methodologies

Methodology	IoU	Time (s)	Energy (J)	Success Rate	Non- GPU	Model Swaps	Pairs Used
Marlin	0.614	0.132	1.201	74.0%	0%	0	1
Marlin Tiny	0.529	0.036	0.33	64.0%	0%	0	1
SHIFT	0.598	0.047	0.262	72.2%	68.7%	42	4.3
Oracle E	0.535	0.025	0.144	76.0%	31.5%	94	6.7
Oracle A	0.657	0.108	1.423	76.0%	44.9%	409	12.3
Oracle L	0.522	0.025	0.169	76.0%	11.3%	112	6.8

Maintained good results with fewer than half of the swaps and fewer allocated models than oracle methods.

7.5x Energy usage improvement
2.8x Latency improvement
0.97x Accuracy performance
vs. YoloV7 on GPU

Priority-based Fast Multi-Object Tracking on Multi-Accelerator Systems

Justin Davis
Ismet Dagli
Mehmet E. Belviranli

Under Submission at MOBICOM25

Object Detection vs. Tracking Cost Disparity

- Object detection with DNN takes significant resources
- Tracking (with no RE-ID) minimal
- Must optimize detection to make meaningful change

How Can Object Detection be Optimized?

- Change parameter or input size
- Change accelerator
- How can we leverage these 3 knobs?

PMOTHS Overview

- Assess current LP and HP regions from user-defined class-priority labels
- Framepack to reduce computation on LP region
- Schedule to minimize latency

Identifying Priority Objects

- Important objects can take up small portion
- Significant percentage of data could be ignored

MOT17-02

MOT17-09

MOT17-10

MOT17-13

Frame Packing

- Aggregate 'low-priority' cells into smaller image to reduce computational resources required
- Uses simulated annealing and 2D bin-packing

Processor Utilization

Baseline Processor Utilization

26 ms

PMOTHS Processor Utilization

19 ms

MOT17 Results

Methodology	DetA (%)	HOTA (%)	MOTA (%)	IDF1 (%)	Latency (ms)
YOLOv10 M 1280x1280	41.82	11.64	6.45	9.21	25.91
YOLOv10 S 1280x1280	39.69	11.81	7.80	9.16	16.66
YOLOv10 N 1280x1280	37.35	11.40	7.89	9.97	12.22
BigLittle [28]*	41.46	11.52	7.06	9.05	25.99
SHIFT [6]*	19.01	11.11	8.44	9.49	14.64
<i>PMOTHS People</i>	41.70	11.78	7.76	9.28	15.65

3.8x Energy usage improvement
2.2x Latency improvement
2.2x Power draw improvement
0.997x Accuracy performance
vs. Yolo10M-1280 on GPU

Software

trtutils

General purpose TensorRT engines, utilities, and CLI tools with Jetson integration.

Purpose

- Easy-to-use abstractions in Python
 - Students
- No performance sacrifice
 - SHIFT + PMOTHS
- General purpose
 - SHIFT + PMOTHS
- Concurrent
 - PMOTHS

```
from pathlib import Path
from trtutils import TRTEngine

def main() -> None:
    engine = TRTEngine(Path("example.engine"), warmup=True)

    rand_input = engine.get_random_input()
    outputs = engine.execute(rand_input)
    print(outputs)

    for output in outputs:
        print(output.shape)

if __name__ == "__main__":
    main()
```

Design Goals

- Ease of use for those already using DNNs
 - Most using PyTorch/Tensorflow
- Fast development time
- Low or no overhead
- Thread-safe
- Can be used on Jetson with GPU/DLA or workstation with GPU

```
from pathlib import Path
import cv2
from trtutils.impls.yolo import YOLO

def main() -> None:
    img = cv2.imread(str(Path("horse.jpg")))
    yolo = YOLO(engine, warmup=True, preprocessor="cuda")
    print(yolo.name)

    tensor, r, p = yolo.preprocess(img)
    output = yolo.run(tensor, postprocess=False)
    p_output = yolo.postprocess(output, r, p)
    bboxes = yolo.get_detections(p_output)
    # OR
    bboxes = yolo.run(img)
    # OR
    bboxes = yolo.end2end(img)

    print(bboxes)

if __name__ == "__main__":
    main()
```

- VPI

- Support majority of CUDA and TensorRT enabled systems with least effort

Python

- Simple
- Slow
- No build system
- GIL
- Managed memory

C++

- Moderate
- Fast
- Requires build system
- Free-threaded

Device & Programming Language Support

- cuda-python and tensorrt
 - 1:1 mapping to C++
 - Supports CUDA 11+
- Create Python CUDA wrappers
- Allows
 - Thread-safety
 - Debugging
 - Automated logic

```
def cuda_malloc(
    nbytes: int,
) -> int:
    """
    Perform a memory allocation using cudart.cudaMalloc.

    Parameters
    -----
    nbytes : int
        The number of bytes to allocate.

    Returns
    -----
    int
        The pointer to the allocated memory.

    """
    with _MEM_ALLOC_LOCK:
        device_ptr: int = cuda_call(cudart.cudaMalloc(nbytes))
        LOG.debug(f"Allocated, device_ptr: {device_ptr}, size: {nbytes}")
    return device_ptr
```

trtutils Software Architecture

Originally supported multiple CUDA backends

- Support matrix too large
- Enables faster development

Handle CUDA/memory allocation separate from execution implementations

trtutils Optimizations

1. Reduce overhead
 1. No Torch function usage
 2. No expensive runtime loads to occupy memory
 3. No unnecessary abstractions
2. Use CUDA kernels directly instead of ML framework
3. No intermediate stream synchronize needed
 1. Everything occurs in single CUDA stream directly
4. Pagelocked memory

trtutils Package Overview

The screenshot shows the trtutils package documentation page. It features a dark theme with a sidebar on the left containing a 'CONTENTS' menu with links to Installation, Tutorials, Usage Guide, API Reference, CLI Reference, Examples, Benchmarking, and Changelog. The main content area is titled 'Welcome to trtutils' and includes a description of the package as a high-level Python interface for TensorRT inference. Below this is a 'Features' section with a bulleted list of capabilities such as simple interface, automatic CUDA memory management, and support for various engines and models. A 'Quick Start' section follows, showing a code snippet for initializing the engine and running inference. The 'Documentation' section lists links to the same contents as the sidebar. 'Indices and Tables' includes links to an index, module index, and search page. Finally, the 'Getting Help' section provides instructions on how to find guides, examples, and report issues.

Welcome to trtutils

trtutils is a high-level Python interface for TensorRT inference, providing a simple and unified way to run arbitrary TensorRT engines. This library abstracts away the complexity of CUDA memory management, binding management, and engine execution.

Features

- Simple, high-level interface for TensorRT inference
- Automatic CUDA memory management
- Support for arbitrary TensorRT engines
- Built-in preprocessing and postprocessing capabilities
- Comprehensive type hints and documentation
- Support for both basic engine execution and end-to-end model inference
- Specialized support for YOLO models
- Performance benchmarking and monitoring

Quick Start

```
from trtutils import TRTEngine

# Load your TensorRT engine
engine = TRTEngine("path_to_engine")

# Get input specifications
print(engine.input_shapes) # Expected input shapes
print(engine.input_types) # Expected input data types

# Run inference
inputs = read_your_data()
outputs = engine.execute(inputs)
```

Batch 1, end-to-end latency

Concurrent Inference – Orin AGX 64GB

Limited in concurrency by DLA engines

- Require occasional GPU layers serializing performance
- Need end-to-end DLA compatible model

Outcomes

1. Faster than existing Python inference frameworks
 1. Pagelocked memory
 2. NVRTC to compile CUDA kernels
 3. No intermediate memory transfer
 4. No intermediate stream sync
2. 'pip' installable, no build requirements
3. Achieve DLA support
4. Multi-thread compatible

OrinAGX-64GB - Input Size and Latency Comparison for yolov8n
Batch 1, end-to-end latency

3090 - Input Size and Latency Comparison for yolov8n
Batch 1, end-to-end latency

Up to 3x faster

Future Work/Direction

1. Use pagelocked memory for inputs
2. Support batching in YOLO
3. Generic detector/classifier
4. Implement research submodule and papers

AXONN

AXONN – GPU/DLA

- Only GPU or only DLA may not provide the most efficient schedule
- Mixing accelerators across DNN allows more granular tradeoff
- Transition cost to swap accelerators

AXONN – GPU/DLA

Figure 6: The comparison between the energy and execution times of the schedules estimated by AxoNN versus the actual energy and execution times measured for the corresponding actual runs. For each network we have targeted varying ranges of ECT that is between the energy consumption of all-DLA and all-GPU execution.

SHIFT - Problem Statement

How can we utilize multiple models and multiple accelerators while optimizing for energy/latency?

- How do we know when we have chosen correctly?
- When do we switch between models or accelerators?

SHIFT - Confidence Graph

Multi-Model Inference

Which models achieve accuracy threshold:

1. All models
2. All YoloV7 + Resnet
3. YoloV7, YoloV7X
4. None
5. All except smallest
6. All models
7. All except smallest

SHIFT Scheduler

- Set of energy/accuracy/latency knobs for user adjustment
- Computes image similarity across image and detected bounding boxes to determine if context is changing
- Maximizes score

$$\text{NCC}(p, c) = \frac{\sum (p - \text{mean}(p))(c - \text{mean}(c))}{(\sqrt{\sum (c - \text{mean}(c))^2} \times \sqrt{\sum (p - \text{mean}(p))^2})} \quad (1)$$

Algorithm 1 Model Scheduling

```

1: procedure SHIFT SCHEDULE( $m, c, i, b$ )
2:    $s = \min(\text{NCC}(\text{lastImage}, i), \text{NCC}(\text{lastBbox}, b))$ 
3:   if  $s \times c \geq \text{accuracyThreshold}$  then
4:     return  $m$ 
5:   end if
6:    $E = \text{scheduler.energy}$  ▷ 0 → 1 model energy
7:    $L = \text{scheduler.latency}$  ▷ 0 → 1 model latency
8:    $W = \text{scheduler.weights}$  ▷ Tuned knobs

CSK GPU

SIMD vs. Multi-Thread vs. CUDA

- Implemented CSK in NumPy and PyTorch
 - NumPy uses SIMD instructions for FFT
 - PyTorch uses multi-threaded or CUDA
- Swap between versions depending on size of object to track
